

GitHub-RStudio Configuration

Olivia Beck and Dr. Matthew Beckman

Prerequisites

- Install R
- Install RStudio
- Install Git
 - Help resources for various operating system: <https://happygitwithr.com/install-git.html> (<https://happygitwithr.com/install-git.html>)
 - If you aren't sure, try this:
 - Open a terminal: "RStudio >> Tools >> Terminal >> New Terminal"
 - After the dollar sign prompt enter these two commands
 - `which git`
 - `git --version`
 - If git is installed, the result will indicate where it is located and what version you are using
 - Once you have it installed carry on to the next section.

```
19:11 Prerequisites ↕  
Console Terminal x R Markdown x  
Terminal 2 ~ /Documents/GitHub/Teaching/STAT-380  
050602:STAT-380 mattbeckman$ which git  
/usr/local/bin/git  
050602:STAT-380 mattbeckman$ git --version  
git version 2.15.1  
050602:STAT-380 mattbeckman$
```

Fig. Terminal Window in RStudio

A more complete guide to configuring Git(Hub) and RStudio is available at <https://happygitwithr.com/> (<https://happygitwithr.com/>), but the work-aid below is generally sufficient for most of our purposes.

- Generate a personal access token: <https://docs.github.com/en/authentication/keeping-your-account-and-data-secure/creating-a-personal-access-token> (<https://docs.github.com/en/authentication/keeping-your-account-and-data-secure/creating-a-personal-access-token>)

In GitHub...

0. Create GitHub user id (if you haven't done so already)
 - I recommend you use some derivative of your actual name (mine is `mbeckman`)

- Choose a name that you are comfortable sharing during a job interview
- Better yet if it's a name that is *recognizable* as you (e.g. a psu id like `mdb268` is fine, but NOT recognizable to those outside Penn State)

1. Log in
2. Create Repo for your project (or navigate to an existing Repo)
3. Click the green button “Clone or Download” and then Copy the URL shown below

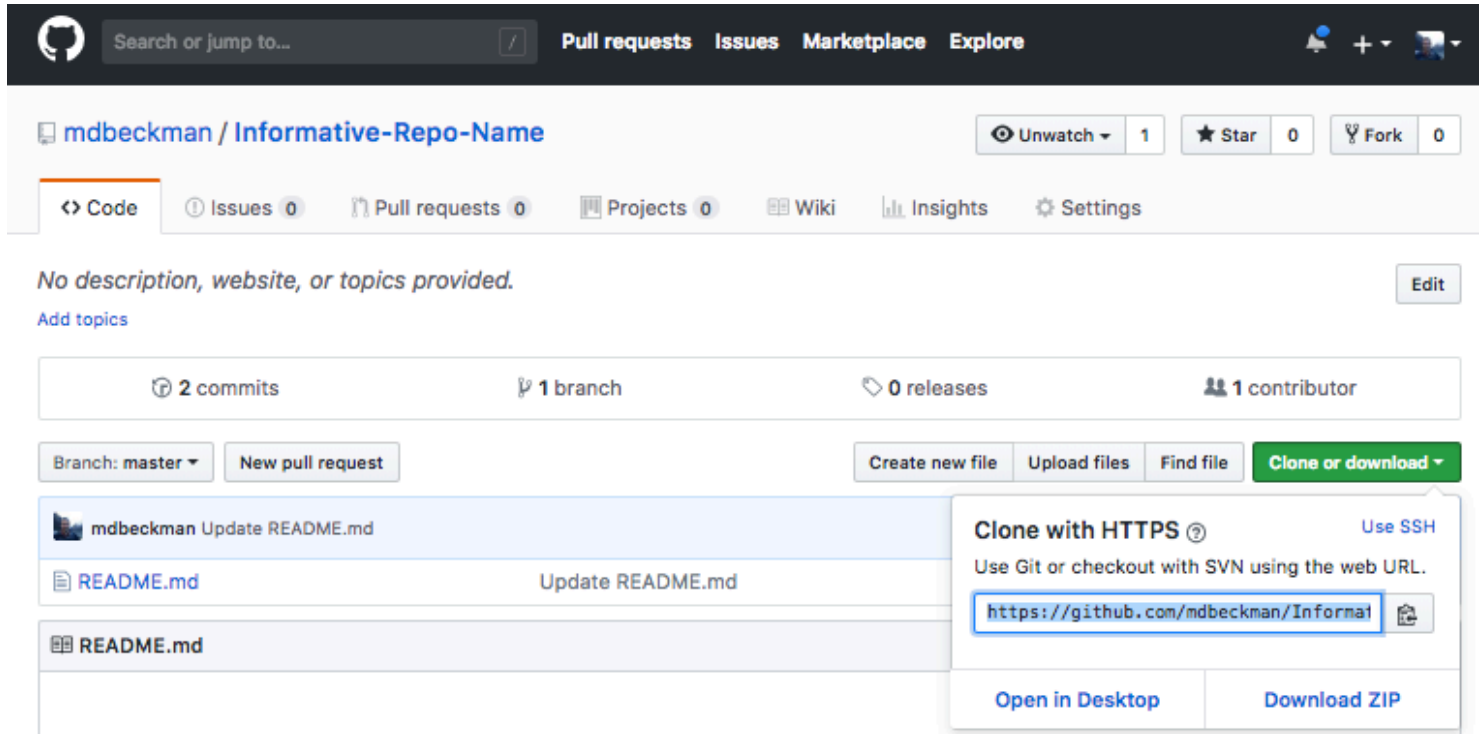

Fig. Cloning a repo

In RStudio...

4. Open RStudio
5. Select “File >> New Project” OR Click on the “Project” menu shown in the upper right corner of the RStudio Window

Fig. New Project

6. Select “Version Control”

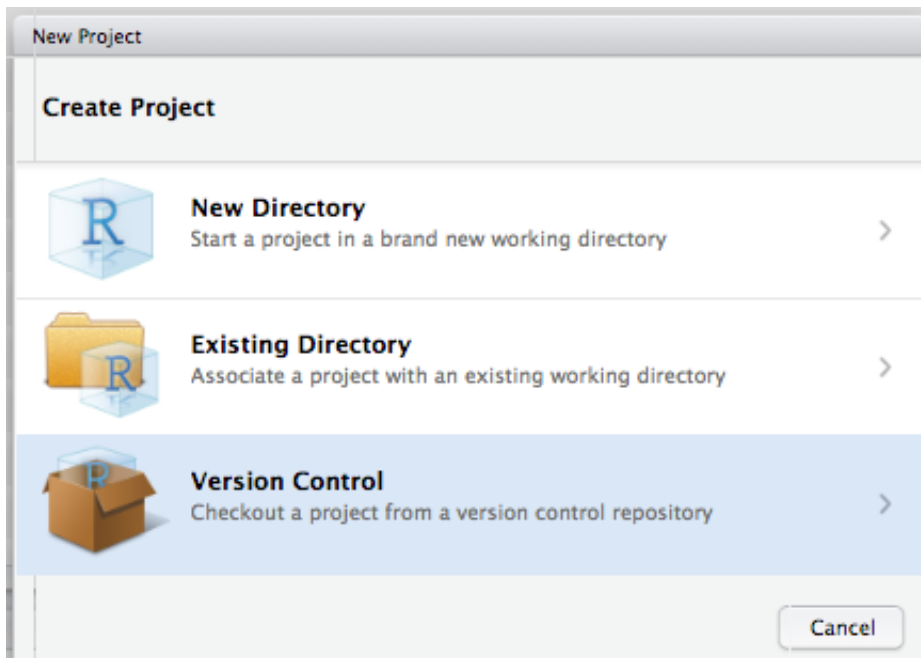

Fig. New Project >> “Version Control”

7. Select “Git”

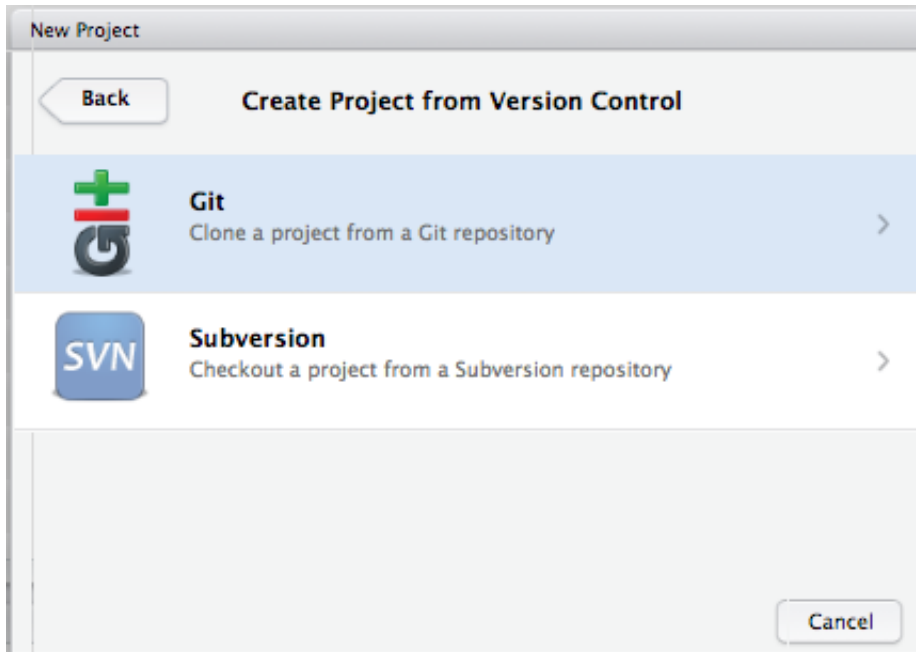

Fig. New Project >> Version Control >> "Git"

8. Establish the connection (Clone Git Repository)

- "Repository URL": Paste the URL that you previously copied from GitHub
- "Project Directory Name": This will be the name of a new folder (i.e. directory) on **your computer**. Use the same name as your GitHub Repo (e.g. mine was "Informative-Repo-Name" here).
- "Create Project as a Subdirectory Of": This is the location on **your computer** for the new folder. For example, I recommend that you make a folder for all of your STAT 380 projects and then put this Repo (and others for STAT 380) together in that directory.

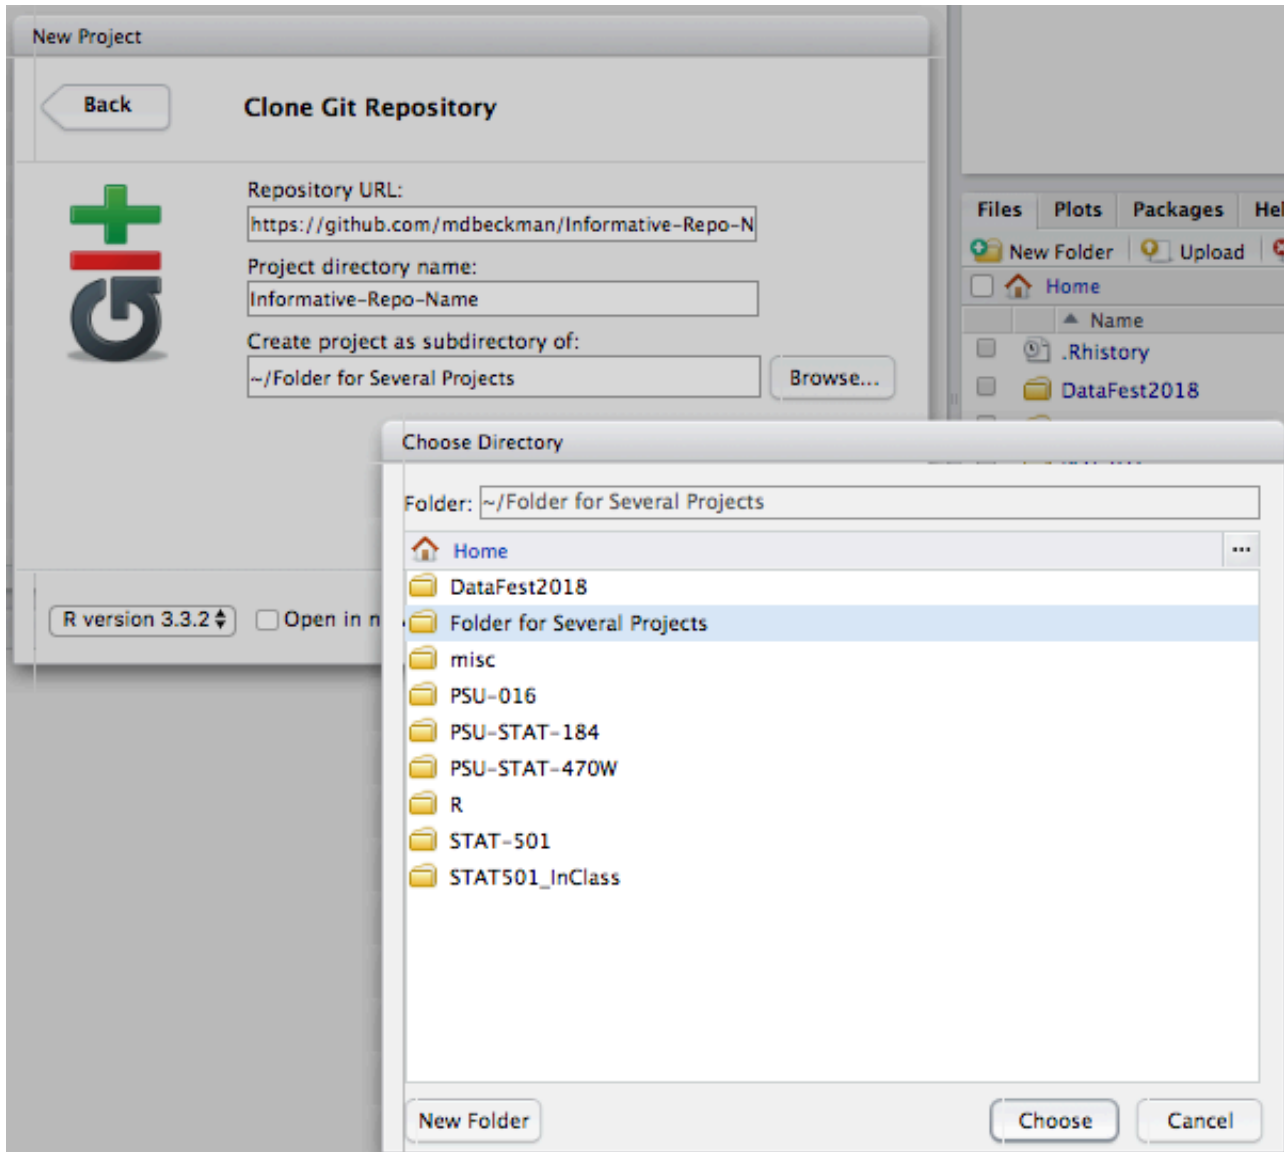

Fig. Local directory

9. You're in! (hopefully)... note the following

- the "Project" menu shown in the upper right corner of the RStudio Server Window now shows the name of my Repo/Project (e.g. mine was "Informative-Repo-Name" in this case)
- a new "Git" tab appears and has started tracking file changes in my Repo. The two files shown (".gitignore" and something ending in ".RProj") basically help Git & RStudio handle logistics, just "commit" and "push" them.

How to push/pull files to/from Github

10. Open the project. Either....

- Open an existing local repository on your computer : Open RStudio. Click on the the project button at the very upper left-hand corner of RStudio, click open project, find the location of the project on your

- computer, click the .Rproj file and open.
- Or clone a repository on your local computer: start at step 2 above.
11. In the “Git” tab, click “Pull”. This will ensure the files on your computer is up to date with the ones on GitHub. If your files are up to date a message will display saying “Already up to date”. If your files are behind what is on GitHub, it will update your local files and give you a list of the files it updated.
 12. Edit your files. Click “save” to save them to your local computer (this does not save them to GitHub.)
 13. Commit your changes
 - select the check boxes to “stage” the changes... only the files you select will be part of this commit
 - Select “Commit”
 - A new window pops up where you should enter an informative commit message and look over the “Diff”... if there were a previous committed version of the file, the Diff summarizes all changes since
 - Press “Commit”
 14. Push your commits to GitHub. The changes aren’t on GitHub until you PUSH them!!
 15. (Optional step I recommend) When you are done working on your current code project, close the project by clicking on the the project button at the very upper left-hand corner of RStudio, click close project. (This will ensure any code you do from here on out does not affect the .Rproj). The projects button should now say “Project (none)”. When you want to open this project back up, start back at step 10!

Repeat steps 10-15!

Using GitHub in STAT184

16. From here on, nearly everything (~90-95%) of your workflow for coding assignments can happen in RStudio... at least in STAT 184. All coding assignments will be hosted in our course GitHub classroom page (this ensure the grader and myself can see everything in your repo). To find the URL you need for step 3
 - Navigate to the class canvas page and open the assignment. Click on the assignment link (this is not the link to the github repo).

ASSIGNMENT LINK:

<https://classroom.github.com/a/OyGa0xq2>

If you do not see your name on the roster list, please let Olivia know asap.

Instructions

- Follow the assignment link above to GitHub Classroom to access your own personal GitHub repo for the assignment
- Select your name from the roster list and begin the assignment
- Carefully review the README document in your GitHub Repo for instructions, hints, and more
 - You will need to connect your RStudio to GitHub

Submit your R Markdown files and R Notebook to Canvas

- This will take you to the assignment link on the GitHub classroom page. Click “Accept this assignment”. There should be a list of the class roster. Select your name from the roster when you accept the assignment. If you ever do not see your name, let Olivia know as soon as possible.

GitHub Classroom

GitHub Education

STAT184-002-fall2022-classroom

Accept the assignment —

Git-test-assignment

Once you accept this assignment, you will be granted access to the `git-test-assignment-olbeck` repository in the `STAT184-002-fall2022` organization on GitHub.

Accept this assignment

- This generates a repo in the **STAT184-002-fall2022-classroom** repo with the name **assignment-name-YourUserName**. In this example, the repo it generated is `STAT184-002-fall2022-classroom/Git-test-assignment-olbeck` (my GitHub username is olbeck). If you did the above step correctly you should see the following page:

GitHub Classroom

GitHub Education

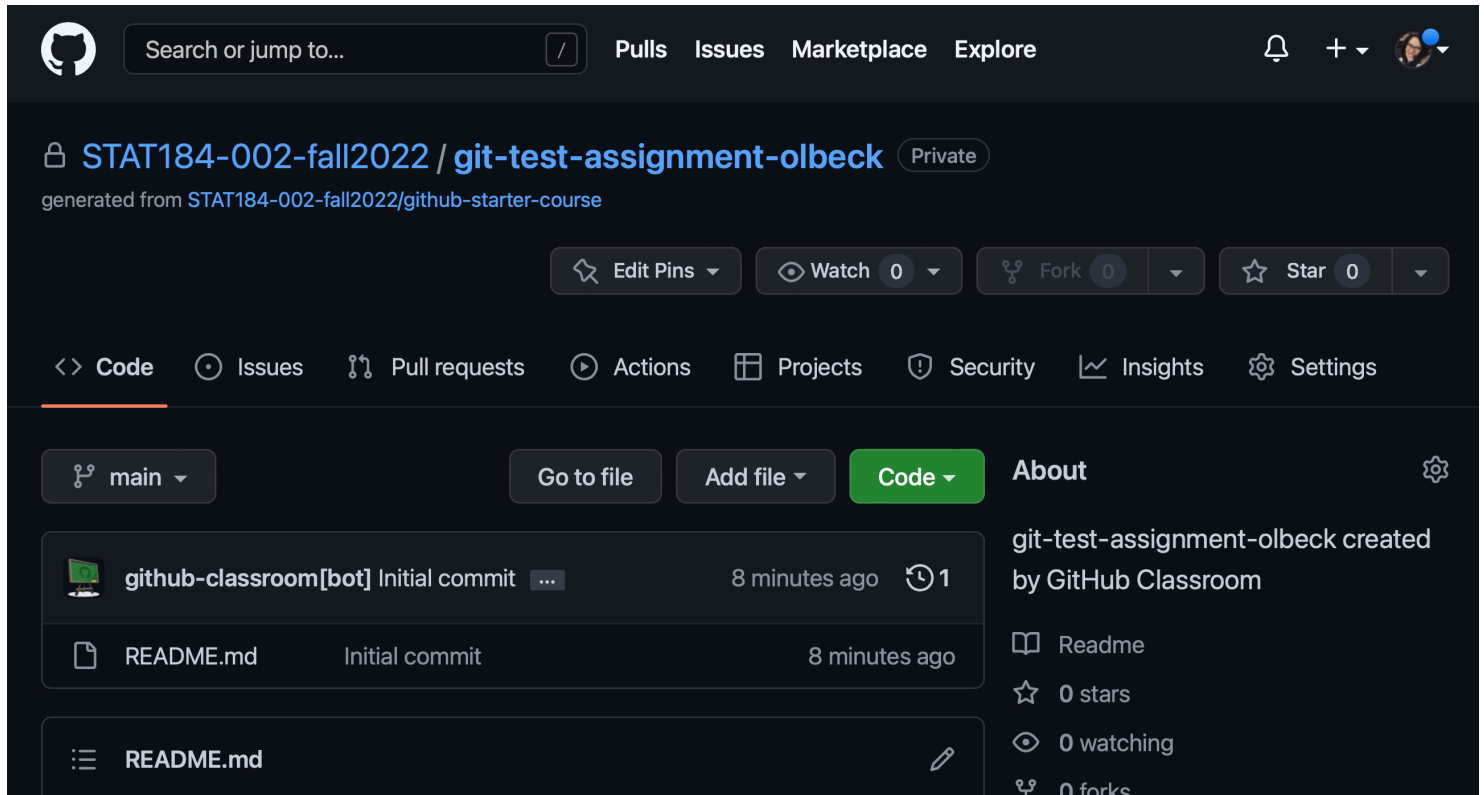

- When you turn in your assignment....
 - I will tell you explicitly in the Canvas Assignment which files I want turned in on Canvas.
 - Your pushed commits are the portion that are “turned in” on GitHub. There is not Turn In or Submit button on GitHub. But since we are doing everything through GitHub Classroom, I can see your repo and read all of your commits and commit messages. These files in GitHub will also be graded. This is why it’s important to push!

17. Accessing Class Notes. Everything that I present in class can be found in our course GitHub page at <https://github.com/STAT184-002-fall2022/course-materials> (<https://github.com/STAT184-002-fall2022/course-materials>). From this link you can start at step 3 to download a local copy of my notes on your computer. Before each class, pull to get the most up to date version of my notes.

18. If (when) you encounter problems look here first...

- <http://happygitwithr.com/> (<http://happygitwithr.com/>)
- Google it!
- Google it again with different search terms!
- Ask a question on the class Canvas Discussions
- Visit office hours/ make an appointment with Olivia
